Ai Documentation

A.

Yes, I agree with your statement, especially in a college setting. College is meant to help students develop critical thinking, problem-solving, and independent learning skills. Using AI ethically means taking responsibility for your own education rather than relying on AI to do the work for you.

For example, using AI to explain a difficult concept, research a topic, brainstorm ideas, or generate an image from your own prompt can be appropriate, depending on your professor's guidelines. However, copying and pasting AI-generated answers into an assignment without understanding the material or acknowledging AI assistance when required can violate academic integrity policies.

I would also clarify that citing AI does not automatically make its use ethical. Students must follow their instructors' rules, verify the information AI provides, and be honest about their contributions.

Ultimately, I believe college students should use AI as a learning tool that strengthens their knowledge and creativity, not as a shortcut that prevents them from developing the skills they need for their future careers.

B.

Yes, I agree with the main point of your statement, especially regarding academic integrity in college. If a professor explicitly prohibits AI use on an assignment or test, using AI to complete that work anyway is dishonest and can have serious academic consequences. Your comparison to looking at another student's paper during a test makes sense because both situations give you an unfair advantage instead of letting you demonstrate your own knowledge.

However, I would adjust one part of your argument. Using AI does not necessarily make someone dumber or cause them to lose brain cells. Instead, relying on AI to do all your academic work can limit opportunities to develop critical thinking, problem-solving, and independent learning skills. AI can also be beneficial when professors permit it as a learning tool.

Your example of a student running out of time is particularly relevant because college students often have busy schedules. Even under pressure, students should follow their professors' AI policies rather than submit work that does not reflect their own understanding.

Ultimately, I agree that students should use AI responsibly and honestly. The issue is not simply whether a student uses AI, but whether that use follows the rules and supports or replaces the student's own learning.
